

IESVE(S) Pte Ltd

Bridging the gap between the real world and stimulation is a single platform for decarbonization namely, the Intelligent Communities Lifecycle (ICL) Digital Twin. Aimed at tackling the built environment at scale – from citizens up to companies, campuses, communities, cities and even whole countries. It is created to enable both an energy efficient design and continuous operation optimization for not just single but entire groups of buildings. ICL Digital Twin achieves all of the aforementioned by:

- Undertake sustainable master planning
- Delve into zero-carbon construction/retrofitting of individual buildings
- Operate buildings or communities more effectively
- Integrate with utilities and renewables to create local energy networks
- Connect, visualise and analyse any data from any source
- Citizen and operational team collaboration and engagement
